Micro-Cap 12 is an integrated schematic editor and mixed analog / digital simulator that provides an interactive sketch and simulate environment for electronics engineers. It has seen twelve generations of refinement since its release in 1982. It blends a modern, intuitive interface with robust numerical algorithms to produce unparalleled levels of simulation power and ease of use.

Fast
Algorithmic improvements, optimized code, and an integrated interface contribute to the stunning speed of Micro-Cap 12.

Extensive Features
- 64-bit version for large circuits
- Multi-page hierarchical schematic editor
- PSpice®, SPICE3, and many HSPICE® commands and models supported
- Threading support for multiple CPUs and faster simulations
- Native digital simulation engine
- Periodic Steady State analysis
- Integral circuit optimizer with multiple optimization methods
- Worst Case analysis with RSS, Monte Carlo, and Extreme Value Analysis
- Smoke / Stress analysis
- Harmonic and intermodulation distortion analysis
- Stability analysis for linear systems
- Integrated active and passive filter design function
- Parts library with over 33,000 parts
- Analog and digital behavioral modeling
- Schematic waveform probing
- On-schematic voltage/state, current, power, and condition display
- Dynamic analysis updates waveforms and curves as you edit
- During the run plotting
- Smith charts / polar plots
- Multidimensional parameter stepping
- Monte Carlo analysis
- Integrated spreadsheet that recognizes simulation values
- 3D plotting
- .Measure and Performance Function plots
- Optimizing parts modeler
- Gummel-Poon, Mextram and Modella bipolar models
- Berkeley BSIM 1, BSIM 2, BSIM3, and BSIM4 MOSFET models
- EKV V2.6 MOSFET model
- Hefner IGBT model
- IBIS model translator
- Animated LEDs, switches, bars, meters, relays, stoplights, and DC motors
- Jiles-Atherton nonlinear magnetics model
- PCB interface to popular packages
- LAN version for collaborative projects

Easy to use
The graphical, user-friendly interface is easy to learn and use. Familiar SPICE models, plus extensions, are easy to apply. Over 400 sample circuit files illustrate common circuit applications.

Affordable
You can easily spend three times the cost of Micro-Cap without matching its power, speed, and ease of use.

Guaranteed
Micro-Cap comes with a full, unconditional, 30 day money-back guarantee.
**Integrated schematic editor and simulator**

The hierarchical schematic editor makes it easy to sketch a circuit. Once a circuit is created, you can do Transient, AC, DC Transfer Function, Distortion, Stability, Smoke / Stress, or Worst Case analysis. The schematic editor features stepping, scaling, panning, multiple-object selection, three axes rotation, mirroring, drag copying, and clipboard functions, with multistage undo and redo. Probe the schematic with the mouse to display curves and waveforms, or use Dynamic Analysis mode to see waveforms change as you edit the circuit.

**SPICE compatible models and simulator**

Micro-Cap reads, writes, creates, and analyzes standard SPICE text files as well as its own schematic files. You can use the schematic editor to create schematics or the text editor to build SPICE text file circuits. Micro-Cap can analyze either format and can use text file subcircuit models in schematics. Micro-Cap also creates SPICE files from its own schematics.

**Native digital simulator**

The internal 5-state, event-driven digital simulator lets you run digital or mixed mode simulations using your own models or those from our extensive digital library.

**Active and passive filter designer**

The active filter designer creates low pass, high pass, band pass, notch, and delay filters with Bessel, Butterworth, Chebyshev, inverse-Chebyshev, or elliptic responses in both polynomial and schematic form. Individual stages can be chosen from many topologies, including Sallen-Key, MFB, Tow Thomas, Fleischer-Tow, KHN, and Acker-Mossberg. The passive filter designer creates low pass, high pass, band pass, and notch filters with Butterworth, Chebyshev, or elliptic responses in several circuit configurations.
Transient analysis-for time-domain waveforms
You can plot digital state, voltage, current, power, energy, charge, capacitance, inductance, B field, and H field. A variety of variables and mathematical functions simplify plots.

AC analysis-for small signal behavior
With AC analysis you can plot voltage or current and produce Bode plots, Nyquist diagrams, Nichols charts, Smith charts, polar plots, and noise. Real, imaginary, magnitude, phase, and group delay operators make analysis and plotting easy.

DC analysis- for large signal DC behavior
You can use DC analysis for various plots, including transfer functions, where one source is varied, and device IV curves, where two sources are varied. Transfer function plots help to determine DC offset, bias, and overall amplifier DC gain.

Distortion analysis
Harmonic distortion analysis creates plots of THD, THDN, SINAD, SNR, and Hn. Intermodulation creates plots of H1, IM2, and IM3. Any of these can be plotted vs. F, VIN, VOUT, PIN, and POUT.

Worst Case analysis
This feature computes the worst case values of critical design parameters based upon RSS (root-sum-of-squares), Monte Carlo analysis, and Extreme Value Analysis. It helps you verify that your design will work under worst case conditions.

Smoke / Stress analysis
Smoke estimates component stress due to junction temperature, power dissipation, secondary breakdowns, excessive voltage and current levels.
**Optimizer-for fine tuning designs**
The integral optimizer tunes parameters to maximize any performance function or to fit any curve, handling many kinds of design optimization problems.

**Parameter stepping- for parameter dependence**
Step parameters to see how circuit behavior is affected. Try different designs, explore limits, and tailor performance.

**Performance Plots-for parameter sensitivity**
You can directly measure and plot performance characteristics versus circuit parameters. Performance parameters include rise time, fall time, pulse width, frequency, period, peak, bandwidth, phase and gain margin, and many more.

**Monte Carlo-for design centering**
Monte Carlo routines construct hundreds of circuits, each containing parts with parameters picked from distributions you choose. This helps identify circuit problems and improves production yield. You can use both absolute and relative tolerances and worst case, Gaussian, or uniform distributions.

**Analog behavioral modeling-what if analysis**
Analog behavioral modeling-for system level simulation Laplace sources let you describe the S-plane linear transfer function of a circuit block. Function sources let you model instantaneous nonlinear behavior. The source can be a mathematical function of any other circuit variable, such as a node voltage or a device current.

Expressions can also be used for resistor, capacitor, and inductor values.

Here are some sample expressions:
- $G*b0/(s^2+b1*s+b0)$ Low pass filter
- $-k*(v(p)-v(c)+u*(v(g)-v(c)))^1.5$ Triode
- $VZ+tempco*(TEMP-28)$ Reference source
- $Sin(2*pi*T)*Exp(-T)$ Damped sine wave
MODEL for optimized device models
If you can’t find what you need in our huge library, you can use MODEL to produce optimized model parameters from data sheet values or graphs.

Nonlinear magnetics model
The Jiles-Atherton magnetics model lets you analyze nonlinear behavior of cores, reactors, and transformers. You can plot the current, voltage, flux, inductance, and B and H fields. The parts library includes models for common ferrite materials.

Advanced bipolar models
In addition to the standard Gummel-Poon bipolar model, Micro-Cap offers the Modella and Mextram models for advanced simulation of bipolar devices.

IBIS translator
Micro-Cap 12 translates IBIS models into SPICE models which accurately reproduce the IBIS Golden Waveforms.

Advanced MOSFET models
Micro-Cap includes the EKV 2.6 and four BSIM models, BSIM1, BSIM2, BSIM3v3.3, and BSIM4.7 for advanced work with short channel devices. Short-distance matching and binning are provided for advanced modeling.

Direct schematic waveform probing
MC12 lets you probe circuits directly for waveforms. Simply point the mouse at a device or circuit node and click. You can plot states, voltage, current, power, energy, charge, capacitance, flux, inductance, B or H field. The probe can display transient, AC, or DC analysis results.
Scope-easy review of waveforms
This feature lets you zoom, pan, size, scale, tag data points, inspect values, and use performance functions to analyze waveforms and curves. You can magnify a waveform, read out its value, check its slope, find a peak, compare it to another waveform, or measure its rise time, fall time, width, period, frequency, peak-to-peak value, and many other performance functions.

Waveform Buffer
This feature saves curves and waveforms for future analysis, display, and comparison. Curves can be saved manually or automatically up to a specified memory limit.

3D plots-design visualization
Plot an expression or performance function versus any two stepped parameters to show temperature or parameter effects.

ADDITIONAL FEATURES

Integrated spreadsheet-data manipulation and display
Built-in spreadsheets can use any variable or expression that is legal in an analysis plot. Prepare custom reports or analyses. Wildcard expressions afford easy access to many similar variables (e.g. 1([C@]) = current through each capacitor).

Large device library
With over 33,000 parts in the device model library, you’ll be able to quickly find most digital parts, and analog parts like diodes, MOSFETs, BJTs, OPAMPs, IGBTs, JFETs, magnetic cores, crystals, and SCRs.

Extensive mathematical operators and variables
Operators include arithmetic, trigonometric, hyperbolic, Boolean, relational, integration, differentiation, and FFT or signal processing types. You can even do Bessel functions and infinite series expressions. Variables include voltage, current, power, energy, charge, flux, capacitance, resistance, inductance, B field, and H field. Device variables include lead currents and lead-to-lead voltages, such as base current and base-emitter voltage of an NPN.

Animated devices-visualization and interaction
Seven segment displays, LEDs, switches, bars, meters, relays, stoplights, and DC motors provide visualization and interaction. Mouse clicks open and close switches, meters read DC voltage and current, relays open and close, seven segment displays respond to digital input states.
Device models

**Analog primitives**
- Battery voltage source
- Voltage source (SPICE format)
- Current source (SPICE format)
- Pulse voltage source
- Sine voltage source
- User-defined file source
- Resistor
- Capacitor
- Inductor
- Diode
- SPICE E, F, G, H sources
- Linear dependent two port source
- Transmission line (lossy or ideal)
- Transformer
- K device (magnetic coupling)
- Bipolar junction transistor (3 models)
  - Gummel-Poon
  - Mextram
  - Modella
- MOSFET models (13 models)
  - Original levels 1, 2, and 3
  - BSIM, BSIM2, BSIM3v3.3, BSIM4.7
  - EKV V 2.6
  - Philips MOS 12, 20, 31, 40, and PSP 122
- Hefner IGBT model
- OPAMP
- GaAsFET (4 models)
  - Curtice
  - Raytheon or Statz
  - TriQuint
  - Parker-Skellem
- JFET
- Analog behavioral sources
  - Laplace function (S-domain expressions)
  - Laplace table (S-domain tabular functions)
  - Function (Time-domain algebraic expressions)
  - Table (Time-domain tabular functions)
- Z transform source
- Sample and hold source
- S-Y-Z-H-G-T-ABCD parameter N-port model
- Switches (3 types)
- Timer function block
- 100+ macro blocks

**Digital primitives**
- Standard and tri-state gates
  - Buffer
  - Inverter
  - And
  - Or
  - Nand
  - Nor
  - Xor
  - NXor
- Edge-triggered flip-flops
  - K type
  - D type
- Gated flip-flops and latches
  - SR
  - Latch
- Digital loads
  - Pullup
  - Pulldown
- Delay line
- Programmable logic array
- Analog to digital converter
- Digital to analog converter
- Analog to digital interface
- Digital to analog interface
- Digital behavioral modeling
  - Pin delay
  - Constraint checker
- Stimulus generator

**Animation primitives**
These versatile devices use motion and color to indicate state behavior and respond to mouse clicks.
- Analog / digital voltmeter/ammeter
- Analog color LED
- Analog color bar
- DC Motor
- Digital LED
- Digital switch
- DPDT, DPST, SPST switches
- Relay
- Seven segment
- Traffic light

**Extensive help system**
- 20,000+ lines of on-line help is context sensitive, indexed, and topically arranged for easy learning.
- Over 500 error messages help you pinpoint circuit problems. Most error messages come with a “More” button for additional description of the nature of the problem.
- Over 400 sample circuits give you plenty of examples to learn design and simulation techniques.
- Over 120 Help Bar notes describe program features as you move the mouse over them.
- Over 20 live demos illustrate the workings of the program.
